

There are a total of five problems. You have to solve the first four. Problem 5 is optional.

Problem 1 (CO1): DFA and Regular Languages (15 points)

Let $\Sigma = \{0, 1\}$. Consider the following languages over Σ . Note that we define 0^m to be the string $\overbrace{000 \dots 000}^{m \text{ times}}$. 1^n is defined analogously.

$$L_1 = \{w : w \text{ does not contain } 01 \text{ as a substring}\}$$

$$L_2 = \{0^m : m \geq 0\}$$

$$L_3 = \{1^n : n \text{ is even}\}$$

$$L_4 = L_2 \circ L_3$$

Now solve the following problems.

- Give** the state diagram for a DFA that recognizes L_1 . (4 points)
- Give** the state diagram for a DFA that recognizes L_3 . (4 points)
- Find** all the four and five-letter strings in L_4 . (1 point)
- Give** the state diagram for a DFA that recognizes L_4 . (2 points)
- If you were to use the “cross product” construction shown in class to obtain a DFA for the language $L_1 \cap L_4$, how many states would it have? (1 point)
- Find** all five-letter strings in $L_1 \cap L_4$. (1 point)
- Give** the state diagram for a DFA that recognizes $L_1 \cap L_4$ using only five states. (2 points)

Problem 2 (CO1): Regular Expressions (15 points)

Let $\Sigma = \{a, b\}$. **Give** regular expressions generating each of the following languages over Σ .

- $\{w : \text{the first and last letters of } w \text{ are } a \text{ and } b \text{ respectively}\}$ (3 points)
 - $\{w : \text{the length of } w \text{ is odd}\}$ (3 points)
 - $\{w : \text{every } a \text{ in } w \text{ is followed by an even number of } b\text{'s}\}$ (3 points)
 - $\{w : w \text{ does not contain } ab\}$ (3 points)
 - $\{w : ab \text{ appears in } w \text{ exactly once}\}$ (3 points)
- (Hint: If $w = xaby$, what can you say about x and y ?)

Problem 3 (CO3): Converting Regular Expressions to NFAs (10 points)

Convert the following regular expression over $\Sigma = \{a, b, c\}$ into an equivalent NFA. Note that $R_1 + R_2$ is the same as $R_1 \cup R_2$.

$$(bc)^*ab + (bc + a^*)^*a$$

Problem 4 (CO3): Converting Finite Automata to Regular Expressions (10 points)

Convert the following DFA into an equivalent regular expression using the state elimination method. First eliminate q_2 , then q_3 , and finally q_4 . You must show work.

Problem 5 (Bonus): Sum of Squares Modulo Three (5 points)

Disclaimer: This is a bonus problem. Attempt it only after you are done with everything else. Even if you do not attempt it, you can get a perfect score. So, do not worry if you find it too hard!

Let $\Sigma = \{0, 1\}$. For $w \in \Sigma^*$, we denote by $h(w)$ the number of 1s in w . For example, $h(100101) = 3$. Consider the following language over Σ . As always, $|w|$ is the length of the string w .

$$L = \{w : |w|^2 + h(w)^2 \text{ is one more than a multiple of three}\}$$

Give the state diagram for a DFA that recognizes L .
